

DEADMOUSE

DEADMOUSE

DEADMOUSE

DEADMOUSE

INSTRUCTIONS

- Pre-soak the cards in canola and/or linseed oil and ensure sufficient bent wire pegs are available to pin them to the ground.
- Select a few paddocks that are representative of your farm to do the monitoring.
- Chew cards should be placed approximately 30m in from the edge of the paddock. Peg each chew card to the ground in a line of 10 cards spaced at 10m intervals. If cards are placed to follow the furrows it will be easy to find the cards again the next morning.
- While walking through the paddock, look for signs of fresh mouse activity or damage.
- Retrieve the chew cards the following morning and assess for evidence of mouse damage:
 - If <10 squares per card are eaten= low-moderate mouse activity.
 - If >10 squares per card are eaten overnight (on average across the 10 cards) = moderate to high mouse activity, with possibility of some damage.
 - If >20 squares per card are consumed (on average across the 10 cards) = high to very high mouse activity, damage is likely and an ongoing mouse problem is present.
