MODE OF ACTION

Carbendazim is a group 1 broad-spectrum fungicide that acts on pathogenic fungi via inhibition of beta-tubulin synthesis. Carbendazim exhibits both protectant and curative action, preventing development of germ tubes, formation of appressoria and the growth of mycelia. It can be absorbed through plant roots or green tissue and is acropetally systemic.

WHY IMTRADE GALLARDO[®] 900?

When used as directed, Imtrade Gallardo[®] provides effective protection from Macadamia Husk Spot in Macadamia, and various diseases of Pulse crops.

- **Stable formulation** Imtrade Gallardo[®] has been formulated as a stable WG formulation. No more 'concrete' layers in the bottom of the drum! Can be stored for long periods without the formulation degrading. Growers and Suppliers can be confident that the product will be usable if they need to carry product over to the following season.
- **High Loading** Imtrade Gallardo[®] is a 900 WG formulation, 1.8 times more active is being delivered per kg! This significantly reduces handling and storage space.
- **No Drums** Imtrade Gallardo[®] comes in a convenient 15kg poly bag
- **Quality Tested in Australia** All Imtrade products are tested in our NATA accredited GLP laboratory before distribution
